

# EvaluAlde Beta Bonus Assignment – College Physics

## II: Electrostatics

### Instructions:

- Answer all questions in detail. Show your work and reasoning for each part.
- Your submission must be a single PDF file. You may type your solutions or handwrite and scan them.
- This assignment is for bonus credit and will help improve our grading tools—thank you for participating!
- Submit your PDF via the usual course submission portal by the posted deadline.

### Questions

#### 1. Coulomb's Law:

Two point charges,  $q_1 = +2.0 \mu\text{C}$  and  $q_2 = -3.0 \mu\text{C}$ , are placed 0.50 m apart in vacuum.

- Calculate the magnitude and direction of the electrostatic force on each charge.
- Is the force attractive or repulsive?

a)

$$F = \frac{k|q_1|q_2}{r^2} = \frac{(8.99 \times 10^9 \frac{\text{N} \cdot \text{m}^2}{\text{C}^2})(2 \times 10^{-6})(3 \times 10^{-6})}{(0.5)^2} = 0.21576 \text{ N} = \text{magnitude + direction}$$

the force on  $q_1$  is in the pos direction and the force on  $q_2$  is in the neg direction  
 $\rightarrow$  forces are directed towards each other

b) Attractive — one charge is positive and the other is negative so both charges pull on each other

## 2. Electric Field of a Point Charge:

What is the magnitude and direction of the electric field at a point 0.30 m away from a  $+5.0 \mu\text{C}$  point charge?

$$E = \frac{k|q|}{r^2} = \frac{(8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)(5 \times 10^{-6} \text{ C})}{(0.3 \text{ m})^2} = 499,144.44 \text{ N/C} = \text{magnitude}$$

direction = away from the charge = in +x direction

## 3. Electric Field from Multiple Charges:

Two charges,  $+1.0 \mu\text{C}$  and  $-2.0 \mu\text{C}$ , are fixed 0.40 m apart.

- Find the electric field at the midpoint between them (magnitude and direction).
- If a  $+1.0 \text{ nC}$  test charge is placed at the midpoint, what force does it experience (magnitude and direction)?

a)

$$q_1 = +1 \mu\text{C} \rightarrow +1 \times 10^{-6} \text{ C}$$

$$q_2 = -2 \mu\text{C} \rightarrow -2 \times 10^{-6} \text{ C}$$

$$r = 0.4/2 = 0.2$$

$$E = \frac{k|q|}{r^2}$$

$$E_1 = \frac{(8.99 \times 10^9)(1 \times 10^{-6})}{(0.2)^2} = 224,750 \text{ N/C}$$

$$E_2 = \frac{(8.99 \times 10^9)(2 \times 10^{-6})}{(0.2)^2} = 449,500 \text{ N/C}$$

$$E_{\text{net}} = 224750 \text{ N/C} + 449500 \text{ N/C} = 674250 \text{ N/C} = \text{magnitude}$$

direction = +x = toward -2  $\mu\text{C}$

b)

$$q = +1 \text{ nC} = 1 \times 10^{-9} \text{ C}$$

$$F = qE = (1 \times 10^{-9} \text{ C})(674250 \text{ N/C}) = 6.7425 \times 10^{-4} \text{ N} = \text{in } +x \text{ direction} = +x \text{ direction}$$

## 4. Electric Potential (Point Charges):

What is the electric potential at a point 0.25 m from a  $-4.0 \mu\text{C}$  point charge? (Assume zero potential at infinity.)

$$q = -4 \mu\text{C} = -4 \times 10^{-6} \text{ C}$$

$$r = 0.25 \text{ m}$$

$$V = \frac{kq}{r} = \frac{(8.99 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}^2)(-4 \times 10^{-6} \text{ C})}{0.25 \text{ m}} = -143840 \text{ V}$$

5. **Potential Difference and Work:**

An electron moves from point A (potential = +100 V) to point B (potential = -50 V).

a) What is the potential difference  $V_B - V_A$ ?

b) How much work is done by the electric field on the electron during this move?

$$\begin{aligned} \text{a) } V_B &= -50 \text{ V} \\ V_A &= +100 \text{ V} \end{aligned}$$

$$V_B - V_A = -50 - 100 = \boxed{-150 \text{ V}}$$

$$\begin{aligned} \text{b) } W &= -q \Delta V = -(-1.6 \times 10^{-19} \text{ C})(-150 \text{ V}) = \boxed{2.4 \times 10^{-17} \text{ J}} \\ &\downarrow \\ &= -1.6 \times 10^{-19} \text{ C} \end{aligned}$$
